

## Safety-Power

For safe machining of short and narrow workpieces on circular table saws

Article no. 3368

Watch Video:

The Safety-Power is a useful fixing aid for safely fixing short and narrow workpieces to the cross-cut fence of circular table saws. It enables cuts in the entire range from  $-45^\circ$  to  $+45^\circ$ . Precise guidance is ensured by the groove on the slide table. The guide elements are adjustable and suitable for groove widths from 19 to 23 mm.

### Application example - cutting short, narrow batten to length:

Set the length and fold down the flip stop:

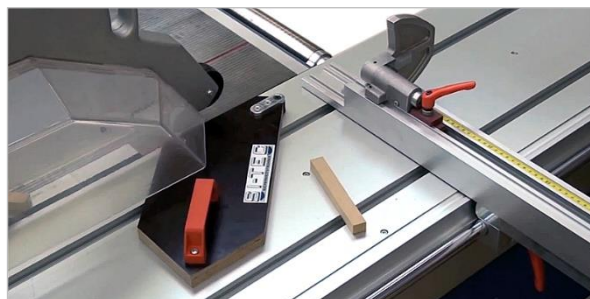

Slide Safety-Power via groove to the workpiece and fix it:

Make the cut by pushing the slide table forward:

Remove the cut workpiece:

### Application example in combination with "Safety-Cut plus":

We also recommend using it in combination with the "Safety-Cut plus" fence extension (Art. No. 3367), which is available as an extension of the "Safety-Cut" (Art. No. 3366) and extends the cross-cut fence by an additional 300 mm.

"Safety-Cut plus" enables cuts down to 0 mm and has 4 different mitre contact surfaces ( $-45^\circ/+45^\circ$ ). This means that even very short and/or workpieces with mitres can be ideally fixed and advanced so that safe machining can be guaranteed at all times.
